Introduction

Ncurity operates in the cybersecurity sector, focusing on protecting organizations from evolving digital threats. The company requires robust, scalable security solutions that can adapt to complex IT environments and provide comprehensive protection across multiple attack vectors.

Scenario

Before implementing Trellix solutions, Ncurity faced significant challenges in managing security across diverse infrastructure components. The company struggled with fragmented security tools that created visibility gaps and operational inefficiencies. Managing separate solutions for endpoint, network, email, and data security resulted in increased complexity and potential vulnerabilities at integration points. The lack of unified threat intelligence and coordinated response capabilities meant security teams spent excessive time correlating alerts from different systems and responding to incidents across disconnected platforms.

Outcome

Following the Trellix implementation, Ncurity achieved unified security management across all critical infrastructure components, delivered through a platform hosted on AWS. Leveraging AWS provided the scalability, resilience, and performance needed to support centralized security operations without adding infrastructure overhead. The integrated platform eliminated previous visibility gaps and enabled coordinated threat response across endpoints, networks, email systems, and data repositories. The hybrid and on-premise deployment model, combined with AWS-hosted services, gave Ncurity the flexibility required to meet compliance requirements while maintaining operational efficiency. Security teams now benefit from consolidated alerting and automated correlation of threats across multiple attack vectors, significantly reducing mean time to detect and respond to incidents. Overall, the comprehensive Trellix suite, backed by AWS, shifted Ncurity's security posture from reactive to proactive, with integrated threat intelligence enhancing the organization's ability to prevent attacks before they impact operations.

Testimonial

Trellix Email Security has proven to be a critical layer of protection for our organization against phishing threats. While we rely on Microsoft 365 for email services, we've seen cases where phishing emails bypassed Microsoft 365's built-in mail security controls. In those situations, Trellix Email Security successfully detected and blocked the messages before they reached users. That additional layer of defense has significantly reduced risk and reinforced our confidence in the solution.
