DATA PROCESSING AND SECURITY AGREEMENT: SUPPLIER SECURITY ADDENDUM

As set forth in the Data Processing and Security Agreement (DPSA) between Company and Supplier (each as defined in the DPSA), by entering into the DPSA, Supplier agrees it will comply with this Supplier Security Addendum.

1. Introduction

This Supplier Security Addendum establishes the Supplier’s minimum security standards for protection of Our Confidential Information, including Personal Data.

To achieve security compliance, Suppliers and their subcontractors are wholly responsible for implementing all the security controls defined herein to protect the data they manage, host or process for any function or activity implemented on behalf of Us. This Supplier Security Addendum is not intended to be an all-inclusive list of security requirements.

Each solution may generate unique or specific requirements that must be addressed with the appropriate security controls and defined in the applicable statement of work executed by the parties. This Supplier Security Addendum should be reviewed by the Supplier’s Chief Information Officer (CIO) or Security Officer (CISO) responsible for contracted services. It is the responsibility of the primary Supplier to review these Supplier Security Addendum requirements with its subsidiaries and subcontractors responsible for service delivery to Us or on behalf of Us and to ensure subcontractor’s compliance herewith.

The Supplier is responsible for conformance to the Supplier Security Addendum when services are performed by itself, its subsidiaries, or its subcontractors. This version of the Supplier Security Addendum covers data classified up to Confidential. The Company business owner (i.e., the person who has strategic and operational responsibility for information at the Company) is responsible for classifying the data of their application and communicating it to the Supplier. At a minimum, Suppliers must be capable of implementing security controls required to protect data classified as Confidential. In the non-standard event that Supplier may receive data classified as Restricted under Our information and classification handling standards, (a) the Company business owner, in coordination with Supplier, will obtain prior approval of the disclosure from the Company’s Chief Information Security Officer and Chief Privacy Officer (or their delegates), and (b) Supplier may be required to enter into a separate non-disclosure and restricted use agreement that includes security and technical requirements beyond those set forth in this Supplier Security Addendum.

Supplier must ensure their subsidiaries and subcontractors are compliant with all regulatory and local governing laws as well as Data Protection Laws for the services under contract to Us. Examples include, but are not limited to, GDPR, CCPA and CAN-SPAN Act compliance. Suppliers are responsible for compliance with any laws and regulatory requirements applicable to their use of the system.

2. General Undertakings

Suppliers shall review all security controls cited in this document and may request clarification where needed. Suppliers shall notify the appropriate Company business owner (as defined above) of full compliance in writing authorized by a Company official. Existing Suppliers that complied with a previous version of the Supplier Security Addendum must review and adhere to instructions in this document as We may have included important updates/changes from previous versions. If a Supplier, its subsidiaries, or subcontractors are not fully compliant to all minimum-security requirements, the Supplier shall provide in writing the extent of non-compliance and give committed plan of action detailing when the requirements will be fully met.

Our Information Security team shall evaluate a Supplier’s security capability. If approved by Us, the Supplier plans will be documented in the contract. During a contract review, a Supplier’s performance of Supplier Security Addendum requirements, the completion of non-compliant security controls plus the Supplier’s track record for prompt remediation of vulnerabilities will be evaluated.
Supplier agrees to implement data protection by design and by default and appropriate technical and organizational measures to ensure a level of security appropriate to the risk.

Supplier acknowledges that Personal Data retention and replication should always be assessed against business need and minimized, either by not collecting unnecessary data or by deleting data as soon as the need for it has passed and that holding any Personal Data presents security risks.

3. **Cloud Services and Systems**

Cloud-based systems may only contain Confidential Information subject to the prior written approval by Us and must be certified to ISO 27001 standards as a minimum. This minimum ISO 27001 certification must not exceed 12 months from the initial date of issue, for the standard to be considered valid. We reserve the right to perform a security review and risk assessment of applications and services containing Confidential Information in the cloud prior to implementation. Any changes to the architecture or function of a service or data model in the cloud that stores Confidential Information must first be reviewed and approved by Our Information Security Department. Applications that require physical separation cannot be on a cloud-based service unless duly segregated and approved in writing by Us. Supplier shall ensure Confidential Information is fully segregated from the Supplier’s other customers and/or third parties. In addition, the Supplier agrees to allow any regulated Customers (i.e., when a government or regulatory body with binding authority (“Regulator”) regulates such entity’s regulated services such as (for example) financial services) or any independent or impartial inspection agents or auditors selected by Us or a regulated Customer, to audit the Supplier and the Supplier agrees to allow Us to provide any such reports to its Customers where required.

4. **Vulnerability Management**

If the Supplier is hosting a public-facing website that has Our name or branding, the Supplier shall perform daily vulnerability scans on all internet facing web sites where Our name has branded content. We are the primary site owner, or Our name is part of the URL. We use a Secure Vulnerability Scanning Solution. Vulnerabilities will be reported to the Supplier for remediation. Supplier can request information for vulnerability reports, demonstration of the vulnerabilities (when available) and remediation support. We will not charge the Supplier for the Secure Scanning Service. We require daily access to the reports. Upon identification of security vulnerabilities in a production application, the Supplier must remediate within the minimal timelines set forth in Section 7.5 below.

If the security vulnerabilities identified by Us through the vulnerability scanning process have not been addressed in the above timelines, We may shut down the web site until the vulnerabilities are remediated. Returning the site to production status requires the site to pass a scan for Our compliance standards. We consider a web site compliant when and only when Our security standards are met. We will notify the Suppliers anytime Our security standards not met.

5. **Organizational Measures**

The implementation and operational effectiveness of all below controls are mandatory. The below organizational measures are derived from Our Third-Party Information Security Risk requirements, which align to leading industry standards.
<table>
<thead>
<tr>

<td></td>
</tr>
</tbody>
</table>

**User Access Management**

The Supplier has a duty to limit access to personal data on a "need to know" basis. The Supplier is required to assess the nature of access allowed to an individual user. The Supplier agrees that individual staff members shall only have access to data which they require in order to perform their duties, prevent use of shared credentials (multiple individuals using a single username and password) and detect use of default passwords. Access control must be supported by regular reviews to ensure that all authorized access to personal data is strictly necessary and justifiable for the performance of a function. The Supplier has policies in place regarding vetting and oversight of the staff members allocated these accounts. A staff member with similar responsibilities should have separate user and administrator accounts. Multiple independent levels of authentication may be appropriate where administrators have advanced or extra access to personal data or where they have access or control of other’s account or security data. The Supplier agrees to have strict controls on the ability to download personal data from an organization’s systems. The Supplier agrees to block such downloading by technical means (disabling drives, isolating network areas or segments, etc.).

<p>| User registration and deregistration | A formal process should exist to management the assignment, adjustment, and revoking of access rights, considering scenarios such as starters/leavers as well as changing of jobs internally within the organization | ISO 27001 A.9.2.1 ISO 27001 A.9.2.2 ISO 27001 A.9.2.6 |                      |
| Least Privileged Access / Role Based Access | End users shall only be provided with access to IT/network applications based on the requirements of their role within the organization. By default, an end user should have access to a limited amount of IT resources (i.e., email) unless otherwise authorized by appropriate personnel. In circumstances where an end user requires access to a specific IT application, the minimal level of access required to perform their duties should be granted | ISO 27001 A.9.1.2 |                      |</p>
<table>
<thead>
<tr>
<th>Control Title</th>

<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Accounts are locked after 5 incorrect login attempts</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Unique Use of User IDs</strong></td>
<td>End users should each be assigned an individual user ID or identifier for accessing IT resources to ensure accountability. In circumstances where generic user IDs may exist for various business reasons, only one (1) user should have access to such accounts</td>
<td>ISO 27018 A.11.8</td>
<td></td>
</tr>
<tr>
<td><strong>User Access Reviews</strong></td>
<td>End user access to IT applications/resources should be reviewed periodically at defined intervals by appropriate personnel (e.g., application owner, line manager) to ensure all end users within the organization have the appropriate level of access to perform their duties, and that excessive access rights are not granted</td>
<td>ISO 27001 A.9.2.5</td>
<td></td>
</tr>
<tr>
<td><strong>Physical &amp; Environmental Security</strong></td>
<td>In addition to technical security measures, Supplier has implemented the physical security measures which are necessary to ensure the security and integrity of any Personal Data processed. The physical security measures include at minimum:</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• perimeter security (monitoring of access, office locked and alarmed when not in use);</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• restrictions on access to sensitive areas within the building (such as server rooms);</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• computer location (so that the screen may not be viewed by members of the public);</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• storage of files (files not stored in public areas with access restricted to staff with a need to access particular files);</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• secure disposal of records (effective &quot;wiping&quot; of data stored electronically; secure disposal of paper records).</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Building Security</strong></td>
<td>Physical security mechanisms for entering the premises are implemented to ensure that</td>

</tr>
<tr>
<td><strong>(Perimeter)</strong></td>
<td>only authorized individuals have access.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| **Building Security (Internal)** | Additional physical security mechanisms for entering areas which contain critical/sensitive information should be restricted to the appropriate personnel (e.g., server room). Video surveillance/intrusion detection capabilities should monitor access to such working area entry points | ISO 27001 A.11.1.2  
ISO 27001 A.11.1.3  
ISO 27001 A.11.1.5 | |
| **User Workspace** | Supplier-managed devices such as laptops should have appropriate mechanisms installed to ensure protection when unattended. In support of such, a clean desk policy shall be implemented to minimize the existence of physically stored information | ISO 27001A.11.2.8  
ISO 27001A.11.2.9 | |
| **Operational Security** | • Suppliers are responsible for data protection, privacy compliance, and security control validation/certification of their subcontractors.  
• All data provided by Us should be encrypted using AES-128 or stronger.  
• To protect data integrity, data should be hashed using SHA-256 or stronger.  
• All Confidential hard copy data that is no longer required must be shredded by use of a crosscut shredder.  
• The print process must be adequately secured to prevent unauthorized disclosure/access.  
• Extra precautions must be in place to protect the Confidential Information stored on portable systems or mobile devices. Devices and data must be stored securely when not in use. Portable systems with Confidential Information must not transfer data by use of Personal Area Networks. Web sites and applications must be backed up in accordance with Business Continuity and Disaster Recovery requirements. | | |
<p>| <strong>Information Backup &amp; Restoration</strong> | Backup copies of appropriate information shall be taken as well as tested regularly in accordance with Supplier's backup policy | ISO 27001A.12.3.1 | |
| <strong>Event Logging</strong> | Event logging should be enabled in IT applications to record actions such as user activities and reviewed periodically to monitor potential information security events | ISO 27001A.12.4.1 | |
| <strong>Change Management</strong> | Changes to business processes or IT applications should be controlled by means of a formalized process, such as a change request process or governed by a change advisory board (CAB) | ISO 27001A.12.1.2 | |
| <strong>Malware Controls</strong> | Capabilities to prevent against and to detect malware should be implemented which are applicable to all IT resources (e.g., by means of antivirus software, firewalls etc.). All such | ISO 27001A.12.2.1 | |</p>
<table>
<thead>

</thead>
<tbody>
<tr>
<td>Vulnerability Management</td>
<td>Supplier shall define a process to identify and remediate vulnerabilities to IT applications (e.g., a patch management process)</td>
<td>ISO 27001A.12.6.1</td>
<td></td>
</tr>
<tr>
<td>End User Software Installation</td>
<td>Supplier shall define rules to govern the installation of software on company devices by end users. Where possible, software should not be installed on company-managed devices by anyone other than IT administrators</td>
<td>ISO 27001A.12.6.2</td>
<td></td>
</tr>
</tbody>
</table>

**Communications Security**

- Supplier must secure all backup media during transportation and in storage.
- Supplier should catalog all media so that a missing storage unit (and which unit it is) shall be easily identified. Supplier should not label media in such a way that it discloses the data it contains or its owner company in a manner that is easily identified by an outsider.
- Supplier should maintain system and application backups that support a total system restore for a 30-day period as a minimum. Backup media must be on separate media from the system.
- Supplier must destroy all Confidential Information within 30 days of termination of Supplier contract.
- Copies of Confidential Information on system backup media that is co-mingled with other system data are not included.

**Network Security**

Corporate network is controlled to protect information by means of security mechanisms and resourcing (incl. segregated where appropriate)

ISO 27001A.13.1.1  
ISO 27001A.13.1.2  
ISO 27001A.13.1.3

**Encryption of Data**

Sensitive information shall be encrypted during transmission

ISO 27001A.13.2.1

**Incident Management**

As part of a data security policy, the Supplier has a policy in place describing what it does in case of a data breach, and represents it has the capacity to respond adequately in order to cover the requirements of mandatory breach reporting (where applicable) under applicable Data Protection Laws.

- Any security event involving or impacting Us and/or one of Our websites must be reported. Notification must be within 48 hours from detection if Our data, the Our brand, logo or trademarks are involved or compromised.
- Any security event where Our website had unauthorized access or was compromised must be reported.
- All systems and applications must be designed to log, monitor, and report all security events. Logs must be tampered proof and/or off system write only log files. In the event of an incident, audit trails must be available to assist investigations. We may request to cooperatively work with the Supplier on security forensics for some incidents.

**Incident Detection & Response**

Supplier has in place a formalized structure (e.g., a security operations center) to ensure detection and response to information

ISO 27001A.16.1.1  
ISO 27001A.16.1.2  
ISO 27001A.16.1.3
<table>

</tr>
<tr>
<td>Employee Reporting</td>
<td>Employees/contractors have mechanisms available to report potential incidents or security weaknesses observed</td>
<td>ISO 27001 A.16.1.5</td>
<td></td>
</tr>
</tbody>
</table>

**Business Continuity & Disaster Recovery (BCDR)**

- Cloud-based services require a non-cloud-based solution as one of the Business Continuity/Disaster Recovery options in the event of an incident.
- Supplier must have a disaster recovery plan in place in the event that a major disruptive incident impacts their ability to provide service.
- Mission or business critical functions must have a recovery or continuity plan in place per the mutually agreed upon Service Level Agreement.
- Defined strategies must be tested annually and revised where necessary.
- All system media has a regularly scheduled backup and restore capability implemented and tested. Supplier personnel responsible to support business and disaster recovery functions must be identified to Us upon request.

**BCDR Processes**

Supplier has in place contingency plans or business recovery strategies, which are inclusive of the concepts of Information Security & Privacy

ISO 27001 A.17

---

### 6. Server Security

#### 6.1 Intrusion Detection

- All production servers must be located in a secure, access-controlled location.
- All systems must be hardened prior to production use including patching of known vulnerabilities. Disable all generic, guest, maintenance, and default accounts.
- Patching of security vulnerabilities to the operating system and software must meet or exceed the service level interval defined by the vendor for the threat level of the vulnerability.
- Test accounts and user accounts are removed/revoked when no longer required.
- Development and test systems are isolated from production environment and network.
- Disable all non-required ports and/or services on server operating systems and firewalls.
- Consoles with keyboards have password protected screen savers that logoff when left unattended.
6.2 Virtualized System

- All Intrusion Detection Systems in place should be configured to provide data on demand, to identify sources of a potential attack/intrusion at the network perimeter.
- Systems should have the ability to detect a potential hostile attack. Examples include but are not limited to: Network Intrusion Detection or Host Intrusion Detection/Prevention.
- Any single image of data classified as Confidential defines the minimum-security requirement for all virtual instances on the same host system.
- Virtualized systems may contain data classified as Confidential Information. (c) Applications that require physical separation cannot be on the same host system.

6.3 Cloud Services and Systems

- Any single image of data classified as Confidential defines the minimum-security requirement for all virtual instances in the cloud.
- Cloud based systems may contain Confidential Information. We reserve the right to perform a Security review and Risk Assessment of applications and services containing Confidential Information in the cloud before implementation.
- No services will be run from the cloud that interacts with data exceeding the Trellix classification of “Confidential”. (d) Existing services containing Confidential Information may not be pushed to the cloud or transferred to cloud service vendors without Our approval. It is subject to approval following a Security Review and Risk Assessment by Us.

7. General Requirements

7.1 Application Development

- The application and associated databases must validate all input fields for positive and negative bounds defined.
- Implement safeguards against attacks (e.g., sniffing, password cracking, defacing, backdoor exploits)
- Protect the data by using a least privilege and a defense-in-depth layered strategy to compartmentalize the data.
- Handle errors and faults by always failing securely without providing non-essential information during error handling.
- Log data to support general troubleshooting, success and failure of audit trail investigative requirements, and regulatory requirements, with support for centralized monitoring where appropriate.
- Built-in security controls – built-in access controls, security auditing features, failover features, etc.
- Prevent buffer overflows.
- Avoid arithmetic errors.
- Implement an error handling scheme. Error messages should not provide information that could be used to gain unauthorized access.
• Test data used during development must be non-production simulated data.
• Implement protocols (TCP/IP, HTTP, etc.) without deviation from standards.

### 7.2 Security Reviews

• Web application vulnerability assessments must be performed during the application development and the deployment lifecycle.
• All 3rd party software included in the application must meet all security requirements outlined herein.
• Secure interfaces for USER LOGIN and user data input of Personal Data must utilize certificates signed by a Trusted Certificate Authority (CA) only. Examples: HTTPS / TLS / SSH.

### 7.3 Security of System Files

• Access to source code must be limited and controlled.
• During and after development, all applications must ensure the security of system files, plus access to source code and test data.
• All back-door maintenance hooks must be removed from the application before production use.
• Application architecture must prohibit databases containing confidential information from residing on the same server as the application.
• Databases must be secured as well as the applications and servers on which they reside. Confidential Information is prohibited from residing on systems that have Peer-to-Peer (P2P) applications or Personal Area Networks (PAN).

### 7.4 Application Availability

• All applications should be designed to minimize the risk from denial-of-service attacks.
• All applications should limit resources allocated to any user to the minimum necessary to perform the task.
• All applications must prevent unauthenticated users from accessing data or using vital system resources.

### 7.5 Vulnerability Management

• Supplier is responsible for running its own vulnerability management.
• In addition, We require daily vulnerability scans performed on all internet-facing web sites where We have branded content and is the primary site owner or ‘Our Name’ is part of the URL. We use a Secure vulnerability scanning solution. Vulnerabilities will be reported to the Supplier for remediation. The Supplier can request information for: vulnerability reports, demonstration of the vulnerabilities (when available) and remediation support. We do not charge the Supplier for the Secure scanning service.
• We require daily access to the reports.
• Upon identification of security vulnerabilities in a production application, the Supplier must remediate within the following timelines:
  • Critical: 7 days
  • High: 30 days

- Medium: 90 days
- Low: 180 days

- If the security vulnerabilities identified by Our vulnerability scanning process have not been addressed in the above timelines, We may shut down the web site until the vulnerabilities are remediated. Returning the site to production status requires the site to pass a scan for compliance.

- We consider a web site compliant when Our security standards are met. Our Security will notify the Suppliers of each of the security standards not met.

- Any changes to the architecture or function of a service or data model in the cloud must first be reviewed and approved by Us.

- Applications that require physical separation cannot be on a cloud-based service.

- Cloud vendors are required to have background checks and validation of employees with privileged account access. This includes any third-party vendors that may contract with those vendors and have privileged access as well.

### 8. Network & Client Security

#### 8.1 Remote Access

- There should be no dial-in modems on the network without secondary authentication. (Dialback is not authentication).
- Outbound modems (such as for paging) must have inbound calls disabled.

#### 8.2 Client Security

- Patching of security vulnerabilities to the operating system and software must meet or exceed the service level interval defined by the vendor for the threat level of the vulnerability.
- Clients must have Malware protection with automatic signature updates.
- Systems located in an unsecured area and attached to the Supplier network must not access systems and network segments containing Confidential Information.
- All client systems that access Confidential Information, whether in use or not, must be physically secured.
- Client systems which access Confidential Information from secured locations must have a password protected screen saver or automated logoff after no more than 15 minutes of inactivity of account access. This includes any third-party vendors that may contract with those vendors and have privileged access as well.

### 9. Firewall Setup

- Network segments connected to the Internet must be protected by a firewall and configured to secure all devices behind it.
- All system security and event logs are reviewed regularly for anomalies, and available to Trellix in the event of an incident.
- Unused ports and protocols must be disabled.
- Firewalls must be configured to prevent address spoofing.
• Only TCP ports should be used for web applications.
• Supplier firewalls must be configured to allow scanning of Our Web applications. Our scanning source IP addresses will be provided to the Suppliers.

## 10. Data Security

### 10.1 Data Classification and Handling

- Appropriate security measures must be in place to address data handling, access requirements, data storage and communications (in transit).
- All Our data is Confidential.

### 10.2 Privacy Management

- Applications such as “Software as a Service” used by Us to collect Personal Data must have the URL for Our Privacy Statement embedded into the web page where Personal Data is collected. It is available in all languages.
- Where applicable, individuals must be given the opt-in choice to participate prior to providing their Personal Data. Opt-in selection boxes are not pre-selected by default.
- Where applicable, the system should have the capability of allowing individuals to access/update or delete their Personally Identifiable Information or unsubscribe when requested. This can be an automated or manual process. The process must be clearly explained to the individual.
- System must not transfer Personal Data to other systems or be used for purposes other than specified.
- System must have appropriate security controls to avoid unauthorized access, disclosure and/or use or modification of individuals’ Personal Data.
- The system must adhere to the Federal Trade Commission’s CAN-SPAM Act if it:
  - Requests input of Personal Data from an individual to complete “Email to a Friend” notifications, or
  - The system offers online, subscription-based communication services.
- Supplier has set up protective devices for ensuring the integrity and the authenticity of Personal Data, especially state-of-the-art protective devices against malware and similar security attacks.
- Supplier has implemented measures to prevent Personal Data from undergoing any unwanted degradation or deletion without having a copy immediately usable.
- Supplier will keep records concerning its security, and organizational technical measures as well as records on any security incident affecting Personal Data. Such records shall be made available in a standard format immediately exploitable and available for inspection, upon Our request in the course of a security check or in the framework of an audit for up to 1 year.

### 10.3 Data Protection Security

- Suppliers are responsible for data protection, privacy compliance, and security control validation/certification of their subcontractors.
• For data classified as Confidential, Confidential – Internal Use Only or Restricted, data should be encrypted using AES-256 or stronger.

• To protect data integrity, data should be hashed using SHA-256 or stronger.

• All Confidential hard copy data that is no longer required must be shredded by use of a crosscut shredder.

• The print process must be adequately secured to prevent unauthorized disclosure/access.

• Extra precautions must be in place to protect the Confidential Information stored on portablesystems or mobile devices. Devices and data must be stored securely when not in use.

• Portable systems with Confidential Information must not transfer data by use of Personal Area Networks

• Web sites and applications must be backed up in accordance with Business Continuity and Disaster Recovery requirements.

• Supplier must secure all backup media during transportation and in storage.

• Supplier should catalog all media so that a missing storage unit (and which unit it is) shall be easily identified. Supplier should not label media in such a way that it discloses the data it contains or its owner company in a manner that is easily identified by an outsider.

• Supplier should maintain system and application backups that support a total system restorefor a 30-day period as a minimum. Backup media must be on separate media from the system.

• Supplier must destroy all Confidential Information within 30 days of termination of Supplier contract. Copies of Confidential Information on system backup media that is co-mingled with other system data are not included.

11. Extranet Requirements

• All extranet connectivity into Our connection must be through secure communications.

• All data exchanged with Us for mission or business critical functions, (B2B), require secure intercompany communications (ICC) implemented by Our IT Engineering services. Our program manager is responsible for communications funding and will arrange for the Suppliers to engage with Our engineering services team.

• Supplier is responsible for implementing the secure protocols at their sites

12. Deviation From Use

Any deviation from the requirements of this standard must be approved in writing by Our Information Security.

13. Duration

This standard will remain in effect until cancelled or modified by Our Chief Information Security Officer.
